AIM

To build a Report, a Dashboard, and a Custom Page (using UI Builder) on top of a common Form/data source in a Zoho Creator application — so that the data entered through the Form can be viewed and filtered (Report), summarized visually (Dashboard), and presented through a tailored, script-driven interface (Custom Page/UI Builder).

PROCEDURE

Part A — Building the Report

1. Open the Zoho Creator application and go to the Form on which the report is to be based.
2. From the left pane, click the "+" icon next to Reports and select the report type (List View, Kanban, Calendar, Pivot, Chart, etc.).
3. Choose the Form as the data source, name the report, and click "Create Report".
1. Add/remove columns, set sort order, and apply Criteria/Filters to restrict the records shown.
2. Group records by a chosen field and configure role-based permissions for who can view/edit records.
3. Save the report and preview it in Live mode.

Part B — Building the Dashboard

1. Go to Pages > "+" > Dashboard and name the new dashboard page.
2. Select a grid layout, then click "Add Widget" to insert Charts, KPI/Aggregate values, Tables or existing Reports.
3. For each widget, choose the Form/Report as its data source and define the metric (Sum, Count, Average).
4. Apply criteria to individual widgets to scope each one (e.g. current month only).
5. Arrange/resize widgets on the grid, set an auto-refresh interval, and configure viewer access.
6. Save and open the dashboard in Live mode to confirm all widgets load with accurate data.

Part C — Building the Custom Page (UI Builder)

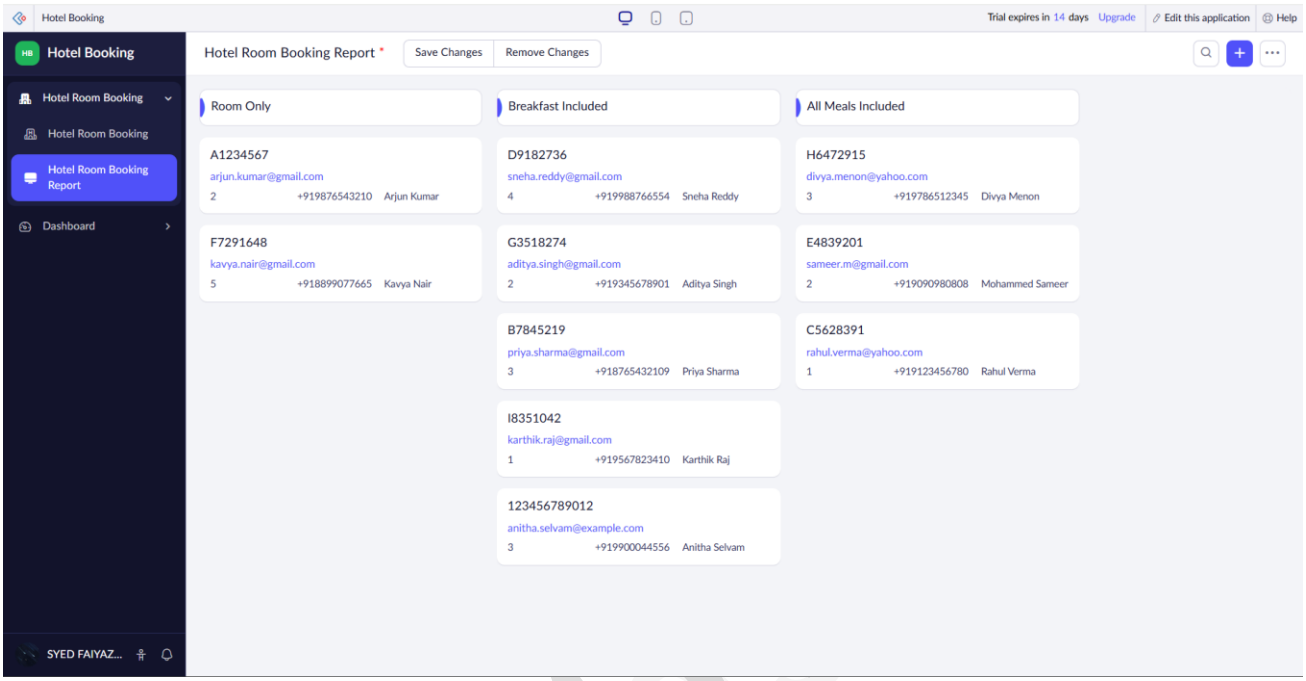

1. Go to Pages > "+" > UI Builder (Custom Page) and choose a blank canvas or a template.
2. Drag components onto the canvas: Text, Image, Button, Form fields, embedded Report/Table, Containers and Tabs.
3. Bind data-aware components (embedded report, chart) to the relevant Form/Report so the page shows live data.
4. Select a Button and open its "On Click" action; write a Deluge script to perform the required action (e.g. add a record, update a field, show an alert).
5. Apply styling (colors, fonts, spacing) and conditional visibility rules from the Style panel.
6. Use Preview to test script actions and responsiveness, then set page-level permissions.
7. Add the page to the application menu and Publish the application.

RESULT

Thus, the Report, Dashboard, and Custom Page were successfully created in Zoho Creator using a common form as the data source. The entered data was displayed and filtered through the Report, summarized using the Dashboard, and presented in a customized interface using UI Builder. Hence, the application data was successfully managed and visualized.
