AIM

To automate a business process in a Zoho Creator application using a workflow and Deluge scripting, and to test and debug the automation in the Hotel Booking application.

Objectives:

- To configure a form workflow that runs automatically when a booking is successfully submitted.
- To write Deluge code that validates the booking data and sends a confirmation email to the guest.
- To test the workflow in the live application and debug any errors until it behaves correctly.

PROCEDURE

Step 1: Create the Workflow

1. Open the Hotel Booking application in Zoho Creator in Edit mode.
2. Select Workflow from the top navigation and open Form workflows.
3. Click New Workflow to open the workflow setup window.

Step 2: Define the Trigger

1. In Choose form, select the Hotel Booking form.
2. For the record event, select Created, so that the workflow runs only for a new booking.
3. For the form event, select Successful form submission, so that it runs after validation.
4. Name the workflow “Send booking confirmation” and click Create Workflow.

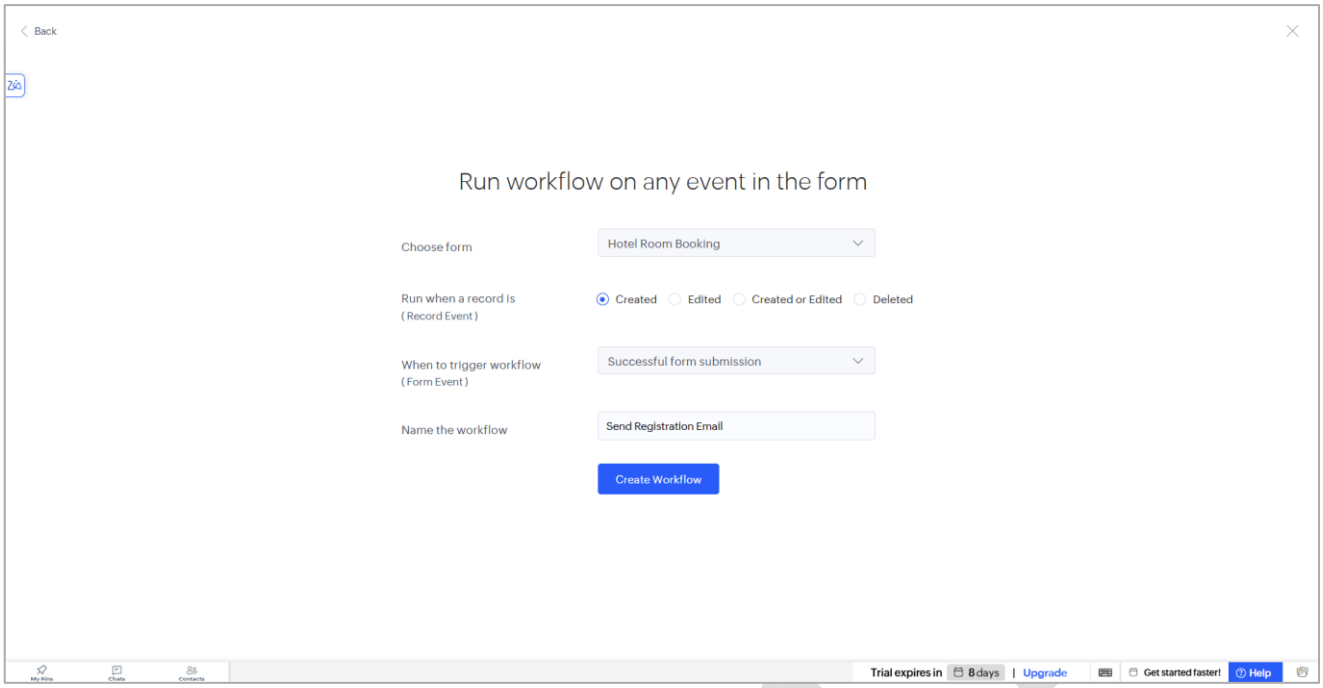

Figure 1: Workflow Setup Window for the Hotel Booking Form

Step 3: Add the Action

1. Inside the new workflow, click Add New Action.
2. Select Deluge script to open the Deluge editor.

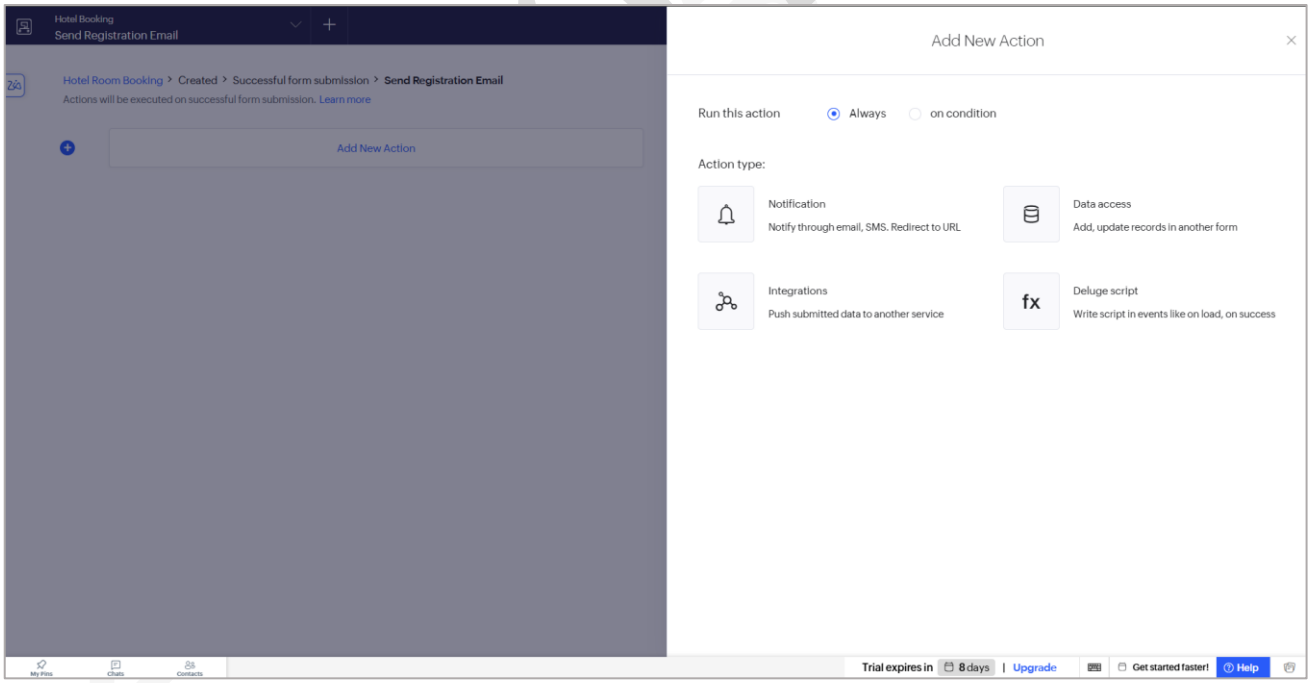

Figure 2: Add New Action Panel

Step 4: Write the Deluge Script

1. Fetch the current booking record using its ID.
2. Check that the guest's email field is not blank.
3. Use sendmail with zoho.adminuserid as the sender and the guest's email as the recipient, and set the subject and message.

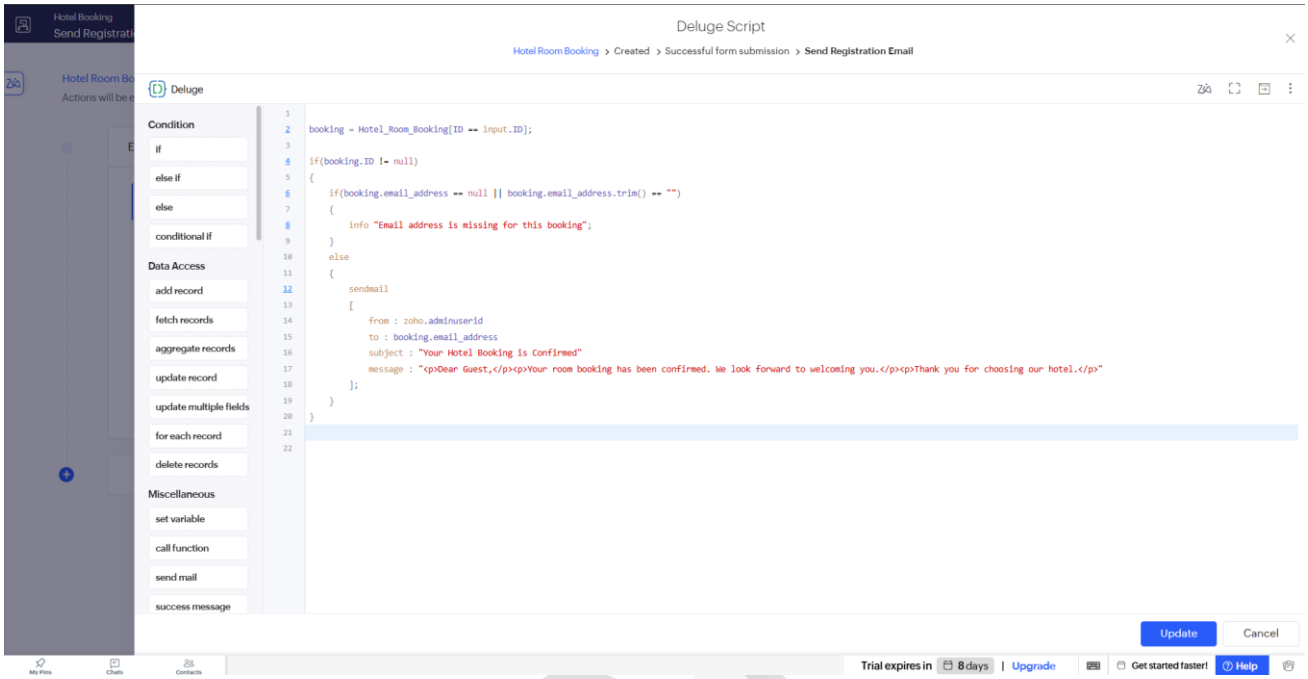

Figure 3: Deluge Script Editor

The Deluge script used in the workflow is given below, and Figure 4 shows its logic.

```
// Fetch the current booking record
booking = Hotel_Room_Booking[ID == input.ID];
// Validate that the email field is not blank
if(booking.ID != null)
{
	if(booking.email_address == null || booking.email_address.trim() == "")
	{
		info "Email address is missing for this booking";
	}
	else
	{
		// Prepare and send the confirmation email
		sendmail
		[
			from :zoho.adminuserid
			to :booking.email_address
			subject :"Your Hotel Booking is Confirmed"
			message :"<p>Dear Guest,</p><p>Your room booking has been
confirmed. We look forward to welcoming you.</p><p>Thank you for choosing our
hotel.</p>"
		]
	}
}
```

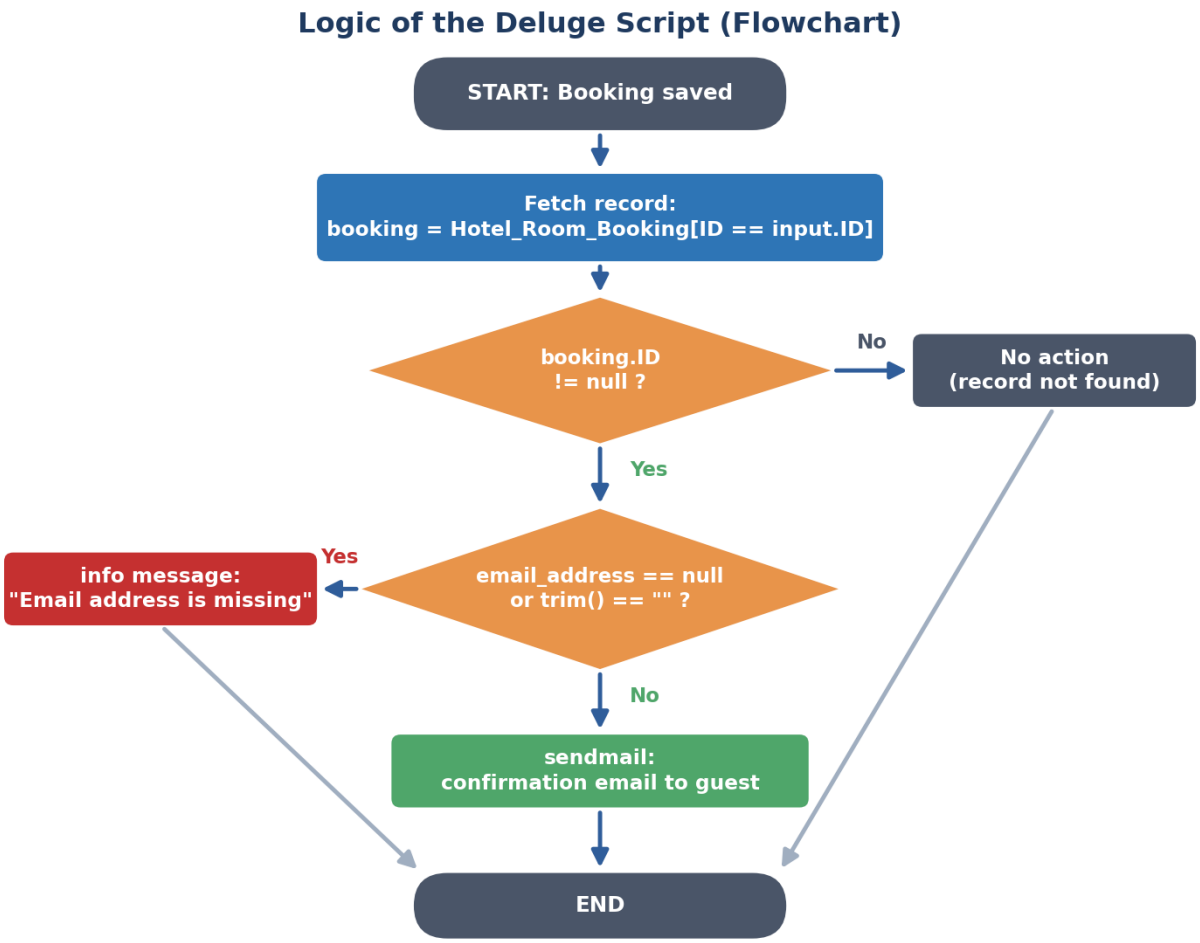

Figure 4: Logic of the Deluge Script (Flowchart)

Step 5: Save the Script

1. Review the code for syntax errors, mismatched brackets and missing quotation marks.
2. Click Update to save the script and activate the workflow.

Step 6: Test and Debug

1. Switch from the editor to the live application (Access this application).
2. Open the Hotel Booking form, fill in all the fields with test data using an email address that can be accessed, and click Submit.
3. Check the Hotel Booking report for the new record and the guest's inbox for the confirmation email.
4. If the email does not arrive, check the script for errors, confirm that the email field has a value, use an info statement to display values, and verify that the workflow trigger is Created and Successful form submission.

OUTPUT

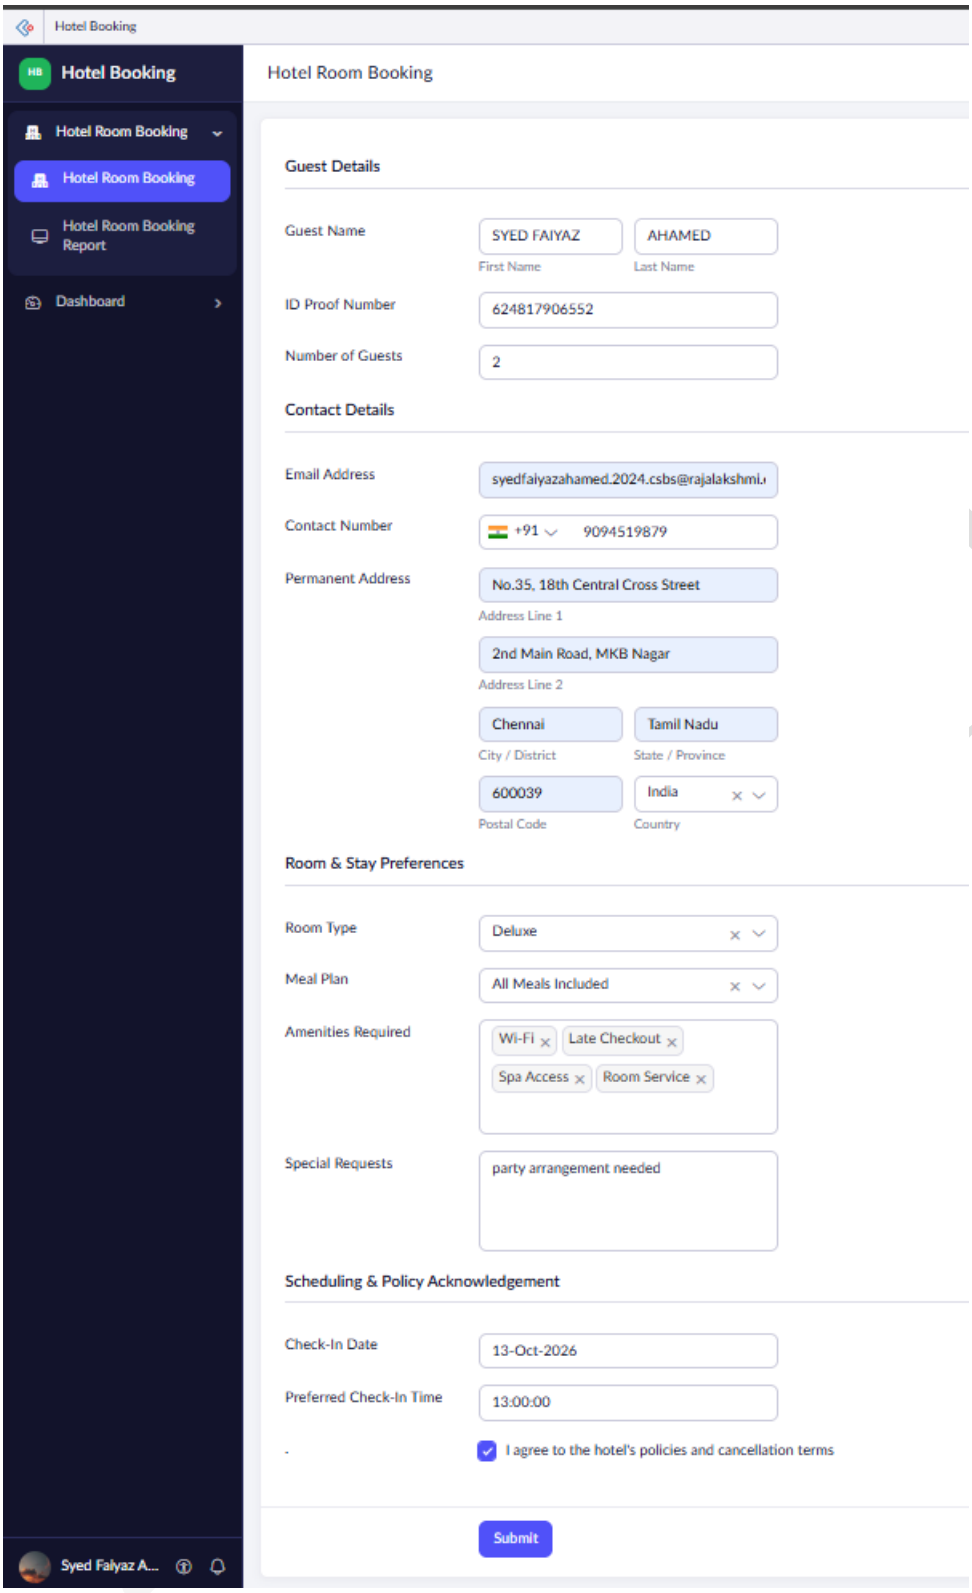

Figure 5: Hotel Booking Form Filled with Test Data

Figure 6: Confirmation Email Received in the Inbox

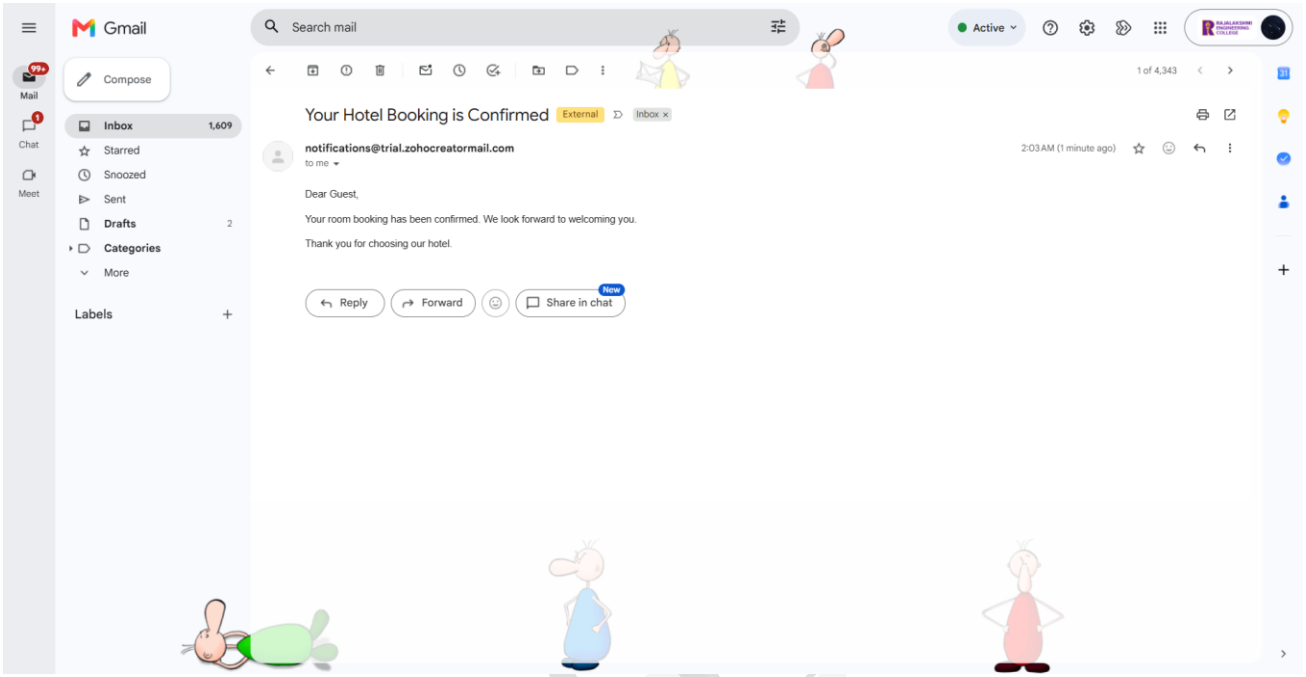

Figure 7: Opened Email – "Your Hotel Booking is Confirmed"

- **Workflow activation:** the trigger was mapped to the successful submission of the Hotel Booking form without errors.
- **Script validation:** the Deluge code passed the syntax check and was saved.
- **Live execution:** submitting the form created a new record, and the confirmation email "Your Hotel Booking is Confirmed" was delivered to the guest's email address.

RESULT

The booking confirmation process was automated using a form workflow and Deluge scripting. On successful submission of a booking, the script fetched the record, validated the email field and sent a confirmation email to the guest automatically. Testing and debugging confirmed that the workflow executed correctly.
